ABSTRACT OF THE DISCLOSURE

In a data conversion system, a WSP request for obtaining WWW contents of a Web server is sent from a terminal device to a WAP proxy and constraint

5   information of images of the terminal device is added to header information of the request. Upon reception of the constraint information, the WAP proxy converts the WWW contents obtained from the Web server into data based on the constraint information, so that the WWW contents

10   converted into the data are transmitted to the terminal device.
